

As ABSOLARE, we feel deeply sorry for the devastating effects of COVID-19. The true heroes of this warfare are all the experts involved in the medical system – doctors and nurses who are at constant high risk of being exposed to the Coronavirus.

We have been in constant communication with some of our Medical Doctor friends and they have all emphasized the risk is greatest during the process of intubating the patient where the virus is most contagious due to close physical contact with the patient.

While there are intubation cabinets in the market, their cubical shape hinders the physical movement of medical staff and are not optimally ergonomic.

We bring a solution to these design limitations by introducing a radius in order to overcome the ergonomic restrictions to the medical personnel.

The prototypes were sent to a reputable university hospital in Europe where the units are seamlessly constructed without fixings – a completely rigid construction using a special acrylic that will be durable and comfortable with minimal mechanical resonance. Using a dummy in the hospital trials, all tests and measurements passed the requirements.

We have produced 100 units to begin with, and have donated them to dozens of hospitals throughout the country. We will distribute the pdf files of the technical drawings to all those who wish to manufacture the same in their respective countries with the hope of further protecting our heroes.

Please contact info@absolare.com to request the technical drawings.
